# EXPERIMENTAL SURFACE PRESSURE DISTRIBUTIONS FOR A FAMILY OF AXISYMMETRIC BODIES AT SUBSONIC SPEEDS

By Charles H. Fox, Jr.  
Langley Research Center

## SUMMARY

An investigation was conducted in the Langley high-speed 7- by 10-foot tunnel to determine the surface pressure distributions over a family of axisymmetric bodies. The bodies were composed of conical or ogival noses, cylindrical centerbodies, and boattailed or flared afterbodies. Surface pressure orifices were located along the longitudinal meridian in the vertical (pitch) plane, circumferentially at selected stations, and on the base. The models were tested at Mach numbers from approximately 0.4 to 0.8 through an angle-of-attack range from approximately  $-4^{\circ}$  to  $20^{\circ}$  at an angle of sideslip of  $0^{\circ}$ . The Reynolds number varied from  $0.4 \times 10^6$  to  $0.7 \times 10^6$  based on body reference diameter. The results of the study are presented as pressure coefficients in tabular and plotted form with limited analysis.

## INTRODUCTION

The ability to predict accurately the aerodynamic characteristics of aerospace vehicles is essential to many NASA programs. The successful development of theoretical methods of predicting aerodynamic characteristics requires the availability of suitable experimental data for use in verifying the theoretical predictions. The purpose of the present study was to enlarge this experimental data base by acquiring surface pressure distributions over a family of axisymmetric bodies. An example of the usefulness of the present data in theoretical work is also presented.

## SYMBOLS

Symbols in parentheses are used in the tables.

$C_{p_i}$  (CPI) the  $i$ th pressure coefficient,  $C_p = \frac{p_l - p_s}{q}$

D body reference diameter, 14.605 centimeters

$M_\infty$	free-stream Mach number
$p_l$	local pressure, newtons per meter <sup>2</sup>
$p_s$ (PSTATIC)	tunnel static pressure, newtons per meter <sup>2</sup> (N/(M×M))
$p_t$ (PTOTAL)	tunnel total pressure, newtons per meter <sup>2</sup> (N/(M×M))
$q$ (Q)	dynamic pressure, newtons per meter <sup>2</sup> (N/(M×M))
$X,Y,Z$	body axis system with origin at apex of configuration, X-axis coincides with axis of symmetry and is positive aft, Z-axis is positive in direction of positive normal force
$x,y,z$ (X,Y,Z)	coordinates, centimeters
$\alpha$ (ALPHA)	angle of attack, degrees
$\beta$ (BETA)	angle of sideslip, degrees

## MODELS AND APPARATUS

Drawings of the models are presented as figure 1 and photographs of a typical model installed in the Langley high-speed 7- by 10-foot tunnel are presented as figure 2.

The six axisymmetric configurations were built up from a series of component parts. The configurations are representative of simple shapes that would aid in the verification of theoretical predictions. The configurations are identified by arabic numerals, the components are identified by Roman numerals, and the orifices on each component are identified by arabic numerals. The nondimensionalized orifice locations for each model are given in table I.

The models were rigidly attached directly to the sting as shown in figures 1 and 2. The angle of attack was measured with an accelerometer mounted within each model.

Surface pressures were measured with scanning differential pressure gages which were mounted within each model and referenced to the tunnel free-stream static pressure. The pressure gages are accurate within  $\pm 0.5$  percent of the full-scale values given in table II.

## PRESENTATION OF RESULTS

The results are presented in tabular form as pressure coefficients in tables III to VIII and are plotted for convenience in figures 3 to 8. The tabulated pressure coefficients are presented to five significant digits to facilitate numerical manipulations with a minimum of round-off error. The accuracy of the pressure coefficients is a function of the pressure gages.

A particular set of results may be readily located by using the following table:

	Table	Figure
Pressure coefficients for configuration 1 . . . . .	III	3
Pressure coefficients for configuration 2 . . . . .	IV	4
Pressure coefficients for configuration 3 . . . . .	V	5
Pressure coefficients for configuration 4 . . . . .	VI	6
Pressure coefficients for configuration 5 . . . . .	VII	7
Pressure coefficients for configuration 6 . . . . .	VIII	8
Comparison of theoretical predictions with present experimental data for configuration 5 at an angle of attack of $0^\circ$ . . . . .		9

## DISCUSSION

No analysis of the present experimental data has been made because of the volume of data and the fact that the primary purpose of the investigation was to provide data that might be useful in evaluating new theoretical methods and computer programs.

An interesting example of the usefulness of the present experimental data in theoretical studies of the wake effect is presented in figure 9. Configuration 5 at  $\alpha = 0^\circ$  was arbitrarily selected for this example. The experimental data from table VII were plotted as a function of the orifice locations from table I for the orifices on the longitudinal meridian. The longitudinal contour of configuration 5 is also presented for convenience.

There are a number of theoretical methods suitable for calculating the pressure distribution on configuration 5. The theoretical calculations presented in figure 9 are the result of a relatively simple surface source distribution calculation presented in the appendix. The theoretical calculations were made for the shape of configuration 5 with the blunt base and sting replaced with an arbitrarily chosen  $12^\circ$  cone as shown in figure 9. The theoretical modeling of the base and sting with a cone results in very good agreement between theory and experiment, and for this particular configuration, appears to be an adequate method of representing the wake region.

## CONCLUDING REMARKS

An investigation was conducted in the Langley high-speed 7- by 10-foot tunnel to determine the subsonic surface pressure distributions over a family of axisymmetric bodies. An example has demonstrated the usefulness of this experimental data in assisting in the development of theoretical methods for predicting the aerodynamic characteristics of this type of configuration.

## APPENDIX

### SURFACE SOURCE DISTRIBUTION METHOD

#### Symbols

$a$  slope of source panel in  $X$ - $Z$  plane,  $\tan \delta$

$$d = (x^2 + y^2 + z^2)^{1/2}$$

$$d' = (x'^2 + r'^2)^{1/2}$$

$i$  index

$M_\infty$  free-stream Mach number

$m$  slope of source panel side edges in  $X$ - $Y$  plane

$P$  general point in space

$$r = (y^2 + z^2)^{1/2}$$

$$r' = [(y - mx)^2 + (ay - mz)^2 + (z - ax)^2]^{1/2}$$

$U$  free-stream velocity

$u, v, w$  perturbation velocity components in  $x$ -,  $y$ -, and  $z$ -direction, respectively

$v_n, v_t, v_r, v_\theta$  perturbation velocity components normal, tangential, radial, and circumferential to panel surface, respectively

$x, y, z$  Cartesian coordinate system defined in figure A1

$$x' = x + my + az$$

$\alpha$  angle of attack, degrees

$$\beta = \sqrt{1 - M_\infty^2}$$

$\delta$  source panel inclination measured from  $Z$ -axis in meridian plane

## APPENDIX

$\theta$	meridian angle measured from the vertical X-Z plane
$\xi, \eta$	designate x,y location of point on source panel
$\phi$	potential function

### Method

The following surface source distribution calculation method was developed by Frank A. Woodward, a director of Aerophysics Research Corporation, Bellevue, Washington, during the course of research he was performing for NASA.

Consider the arbitrarily tapered source panel shown in figure A1. In compressible flow, the potential function is given by

$$\phi(x,y,z) = -\frac{1}{4\pi} \iint \frac{d\xi d\eta}{\sqrt{(x-\xi)^2 + \beta^2(y-\eta)^2 + \beta^2(z-a\xi)^2}}$$

Evaluating this integral and taking partial derivatives, the perturbation velocity components are

$$u = \frac{\partial \phi}{\partial x} = \frac{-1}{4\pi(1 + \beta^2 a^2)} \sum_{i=1}^4 \left\{ a \tan^{-1} \left[ \frac{(z_i - ax_i)d_i}{-x_i(y_i - m_i x_i) - \beta^2 z_i(ay_i - m_i z_i)} \right] - \frac{1}{\beta^2} \left[ \tanh^{-1} \left( \frac{-\beta y_i}{d_i} \right) + \frac{\beta^2 m_i}{\sqrt{1 + \beta^2(a^2 + m_i^2)}} \log \frac{x_i' + d_i'}{\beta r_i'} \right] \right\}$$

$$v = \frac{\partial \phi}{\partial y} = \frac{1}{4\pi} \sum_{i=1}^4 \left[ \frac{1}{\sqrt{1 + \beta^2(a^2 + m_i^2)}} \log \frac{x_i' + d_i'}{\beta r_i'} \right]$$

$$w = \frac{\partial \phi}{\partial z} = \frac{1}{4\pi(1 + \beta^2 a^2)} \sum_{i=1}^4 \left\{ \tan^{-1} \left[ \frac{(z_i - ax_i)d_i}{-x_i(y_i - m_i x_i) - \beta^2 z_i(ay_i - m_i z_i)} \right] + a \left[ \tanh^{-1} \left( \frac{-\beta y_i}{d_i} \right) + \frac{\beta^2 m_i}{\sqrt{1 + \beta^2(a^2 + m_i^2)}} \log \frac{x_i' + d_i'}{\beta r_i'} \right] \right\}$$

Figure A1.- Source panel geometry.

## APPENDIX

These perturbation velocities are shown in figure A2.

The radial and circumferential components of the perturbation velocities are given by

$$v_r = w \cos \theta + v \sin \theta$$

$$v_\theta = v \cos \theta - w \sin \theta$$

The components of the perturbation velocity normal and tangential to the panel surface are then

$$v_n = v_r \cos \delta - u \sin \delta$$

$$v_t = u \cos \delta + v_r \sin \delta$$

The usual boundary condition imposed is that the net velocity normal to the panel surface at the control point is zero. The local panel centroid of area is chosen as the control point. For a body at angle of attack  $\alpha$ , the axial and radial components of the free-stream velocity  $U$  are given by  $U \cos \alpha$  and  $U \sin \alpha \cos \theta$ , respectively. The normal boundary condition may then be expressed as

$$v_n = (v_r + U \sin \alpha \cos \theta) \cos \delta - (u + U \cos \alpha) \sin \delta = 0$$

or

$$v_r - au = U(a \cos \alpha - \sin \alpha \cos \theta)$$

For the calculations presented in figure 9, 34 stations were selected along the longitudinal axis of the body and 7 stations around the half circumference. It should be noted that the theory is not restricted to the zero angle-of-attack case presented in figure 9.

POSTMASTER: If Undeliverable (Section 15-  
Postal Manual) Do Not Ret

*"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."*

— NATIONAL AERONAUTICS AND SPACE ACT OF 1958

## NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

**TECHNICAL REPORTS:** Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

**TECHNICAL NOTES:** Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

**TECHNICAL MEMORANDUMS:** Information receiving limited distribution because of preliminary data, security classification, or other reasons.

**CONTRACTOR REPORTS:** Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

**TECHNICAL TRANSLATIONS:** Information published in a foreign language considered to merit NASA distribution in English.

**SPECIAL PUBLICATIONS:** Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

**TECHNOLOGY UTILIZATION PUBLICATIONS:** Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

*Details on the availability of these publications may be obtained from:*

**SCIENTIFIC AND TECHNICAL INFORMATION OFFICE**
